#### **DETAILED ACTION**

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 12/27/2007 has been entered.

Claims 19-29 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected inventive group, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 4/20/2006.

Claims 1-18 and 30-35 are the current claims hereby under examination.

#### Claim Rejections - 35 USC § 102

### Response to arguments:

Applicant's arguments, filed 12/27/2007, with respect to the rejection of claims under 35 USC 102 have been fully considered and are persuasive because of applicant's arguments. Therefore the rejection has been withdrawn.

#### Claim Rejections - 35 USC § 103

#### The following rejection is being newly applied:

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

10/662,765 Art Unit: 1631

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-18 and 30-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Parsons et al. (US P/N 6, 757,412) in view of Levenson et al. (US P/N 6, 750, 964).

The claims are directed to a method of image analysis comprising transforming an image into a feature space, extracting features, ranking the extracted features, classifying the image into regions of interest, and transmitting the regions of interest for laser capture microdissection.

Parsons et al. teaches limitations of claims 1-2 at col. 14, lines 3-67.

Parsons et al. teaches a method of image analysis at the pixel level of processing. Parsons et al. teaches analyzing tissue image data for classification. First a region of interest is selected and each pixel within the region of interest is analyzed and eventually classified using a classifier, which reads on running the classification algorithm to classify the first image or a

10/662,765 Art Unit: 1631

second image into one or more ROIs at a pixel level of processing, wherein the first or second image selected for classification is a classified image. The images have already been classified into regions of interest using diagnostic modalities, such as mammogram or ultrasound, etc. Then within the region of interest each pixel is analyzed and classified. For each pixel, features are extracted, wherein a feature vector is derived for each pixel as discussed at col. 14, lines 32-37. The feature vector is comprised of feature values for that pixel, such as the temperature response at a corresponding spatial region, which reads on transforming an image into feature space and extracting two or more features from each pixel from the ROI at a pixel level of processing. Each pixel is evaluated within the pre-selected region of interest whether it becomes a pixel of further interest or not. Therefore, many pixels may not be of value or classified into a region of further of interest, but yet are still analyzed, which reads on selecting at least one non-ROI at a pixel level of processing. Furthermore, Parsons et al. at col. 14, lines 45-48 discusses how a classifier is applied to each feature vector for each pixel for classification and a determination is made about the likelihood values indicating the likelihood that the associated spatial region of the tissue belongs to a particular class of tissue.

Parsons et al. suggests, but does not explicity teach ranking the extracted features. Parsons et al. suggests because Parsons et al. at col. 14, lines 40-45 further discusses selecting particular features to quantify different attributes of the temperature response for each pixel, which suggests ranking the extracted features from each pixel. Parsons et al. clearly recognizes more and less

10/662,765

Art Unit: 1631

valuable feature values, which can easily be ranked and filtered accordingly before such feature vector values are put through a classifier for classification.

It would have been obvious to one of ordinary skill in the art at the time of the instant invention to incorporate a ranking method for feature vectors in order to use the most desirable feature values for classification. Ranking is not a new method to the art and one of ordinary skill would immediately envisage the option of implementing such a method step and therefore would not be considered as being an unobvious step that produced unpredictable results.

Parsons et al. does not teach a method of utilizing image analysis for use in a laser capture microdissection. However, Parsons et al discusses at col. 15, lines 1-15 and col. 16, analyzing image data to classify tissues as malignant or benign and disucsses transmitting this data to an appropriate professional. This invention relates to diagnosing tissues, which are cancerous and would need to be removed.

Levenson et al. at col. 2, lines 45-61 teaches a method of laser capture microdissection after target image analysis.

It would have been obvious to one of ordinary skill in the art at the time of the instant invention to combine the analysis and diagnosing methods taught by Parsons et al. with the method of laser capture microdissection taught by Levenson et al. because after diagnosing an individual with cancer it is a necessary step to remove the benign or potentially malignant tumor from the patient. In addition, it would be an inherent step in the process where the information obtained by performing the image analysis steps of Parsons et al.

10/662,765 Art Unit: 1631

would be transmitted and communicated to the station used to perform the laser capture microdissection.

Parsons et al. at col. 15, lines 39-67 teaches the resulting classified image data may be stored for subsequent analysis as in claims 4-5.

Parsons et al. does not explicitly teach the analogous steps of claim1 for a second and third method of processing called subimage processing as in claims 6-18 and 30-35.

However, Parsons et al. at col. 15, lines 39-67 and col. 16, clearly recognizes the potential application of subsequent analysis, which reads on a second and third method of processing or subimage processing. Parsons et al. clearly and obviously envisions further analysis steps being performed on the initial image data analysis used to initially classify the tissue at a pixel by pixel level of processing. It would have been obvious to one of ordinary skill in the art at the time of the instant invention to further perform subimage analysis on the calssified tissue to further narrow down a classified region of tissue and further ensure accurate results of the classified tissue. Parsons et al. teaches a method of classifying a region of interest within a tissue on a pixel by pixel level of interest and to perform further subimage processing is clearly within the envisioned scope of the instant invention. Because Parsons et al. classifies the tissue on a pixel by pixel level, it is further obvious to envision further levels of processing on the exact pixels, which fall into the category of a classified cancer. Therefore, the performance of subimage processing is not considered an obvious 10/662,765 Art Unit: 1631

variation which would result in unpredictable results, but rather is an obvious variation as discussed above.

## Response to arguments:

Applicant's arguments, filed 12/27/2007, with respect to the rejection of claims under 35 USC 103 have been fully considered and are persuasive because of applicant's arguments. Therefore the rejection has been withdrawn.

#### Conclusion

No claim is allowed.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jason Sims, whose telephone number is (571)-272-7540.

If attempts to reach the Examiner by telephone are unsuccessful, the Examiner's supervisor, Michael Borin can be reached via telephone (571)-272-0713.

Papers related to this application may be submitted to Technical Center 1600 by facsimile transmission. Papers should be faxed to Technical Center 1600 via the Central PTO Fax Center. The faxing of such papers must conform with the notices published in the Official Gazette, 1096 OG 30 (November 15, 1988), 1156 OG 61 (November 16, 1993), and 1157 OG 94 (December 28, 1993) (See 37 CFR § 1.6(d)). The Central PTO Fax Center number is (571)-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <a href="http://pair-direct.uspto.gov">http://pair-direct.uspto.gov</a>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
